

## DataWeigher

DBWConsole is the tool to execute the sql scripts in MS Access database.

## DbWeigher

It was created to execute scripts produced by **DbWeigher** and **DBWScript**, it is included into the installation packages of these products.

## DBWConsole

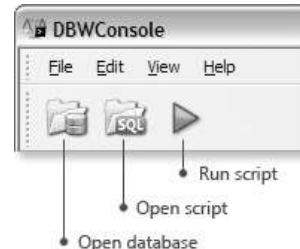

To execute the script, you can open the sql file or copy the script into the edit window using the clipboard. Then you can open the mdb file or create a new mdb file. Use **File > Open Mdb** to open the existing database or create a new one **File > Create Mdb**.

02/01/2014  
DbWeigher 3.8 released.

02/01/2014  
DBWScript 4.0 released.

02/01/2014  
DataWeigher 3.4 released.

**DBWConsole** can be used with the command line parameters. It allows you to run it using the build system like ant, nant, msbuild and so on.

```
Usage: DBWConsole <sql file> <mdb file> [option1] [option2] ...
/c - create the empty mdb file
/o - delete the old mdb file
/e - show an error message in the console instead of the message box
```

If you start it from the command interpreter (batch file), you may need to use **start /wait** to force cmd.exe to pause. E.g.  
`start /wait DBWConsole script.sql database1.mdb`
